# Today

- Project 2 Introduction
- GPU access
- Generative Adversarial Nets (GANs)

# Generative Adversarial Nets

One day we'll be talking about good old "hand-crafted" films and instead the norm will be watching AI-generated (infinite) content on demand

–Andrej Karpathy

# Generative Adversarial Nets

GANs train a network to generate new data with the same features as other data

Used to generate new, fake examples

- images, videos, 3D models, etc

# Generative Adversarial Nets

In the proposed adversarial nets framework, the *generative* model is pitted against an adversary:

a *discriminative* model that learns to determine whether a sample is from the model distribution or the data distribution.

# Generative Adversarial Nets

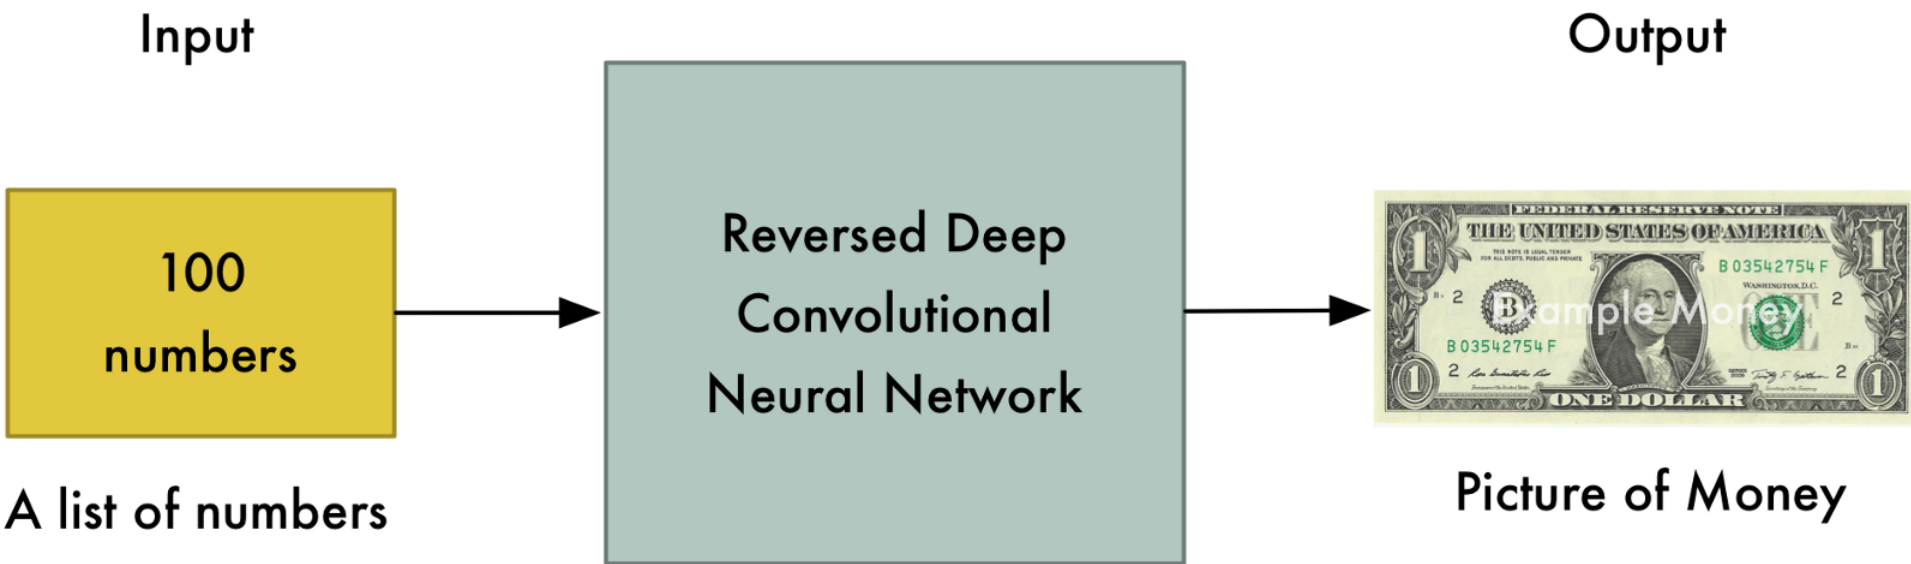

The generative model can be thought of as analogous to a team of counterfeiters, trying to *produce fake currency* and use it without detection, while the discriminative model is analogous to the police, trying to *detect the counterfeit currency*.

# Generative Adversarial Nets

Competition in this game drives both teams to improve their methods until the counterfeits are indistinguishable from the genuine articles.

- the generative model generates samples by passing random noise through a multilayer perceptron
- Goodfellow et al., "Generative Adversarial Nets", 2014

# Improved Techniques for Training GANs, Saliman et al. 2016

Figure 6: Samples generated from the ImageNet dataset. *(Left)* Samples generated by a DCGAN. *(Right)* Samples generated using the techniques proposed in this work. The new techniques enable GANs to learn recognizable features of animals, such as fur, eyes, and noses, but these features are not correctly combined to form an animal with realistic anatomical structure.

# Learning to Generate Chairs, Tables and Cars

Neural networks do not merely memorize images but find a meaningful representation of 3D models, allowing them to:

- Transfer knowledge within object class
- Transfer knowledge between classes
- Interpolate between different objects within a class and between classes
- Invent new objects not present in the training set

# Anime GAN

chainer-DCGAN/](http://matty.github.io/chainer-DCGAN/)

"The Square Kilometre Array (SKA), a radio-astronomy observatory to be built in South Africa and Australia, will produce such vast amounts of data that its images will need to be compressed into low-noise but patchy data. Generative AI models will help to reconstruct and fill in blank parts of those data, producing the images of the sky that astronomers will examine."

# Generative Adversarial Text to Image Synthesis, Reed et al. 2016

this small bird has a pink breast and crown, and black primaries and secondaries.

this magnificent fellow is almost all black with a red crest, and white cheek patch.

the flower has petals that are bright pinkish purple with white stigma

this white and yellow flower have thin white petals and a round yellow stamen

<https://arxiv.org/abs/1605.05396>

# StackGAN: Text to Photo-realistic Image Synthesis, Zhang et al. 2016

The small bird has a red head with feathers that fade from red to gray from head to tail

Stage-I  
images

Stage-II  
images

This bird is black with green and has a very short beak

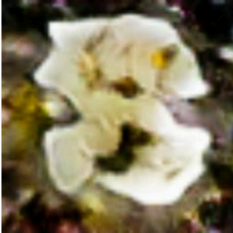

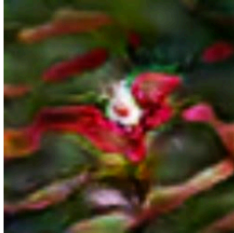

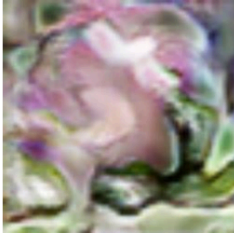

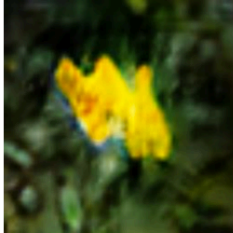

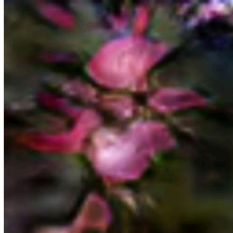

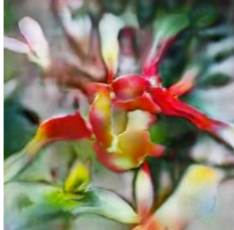

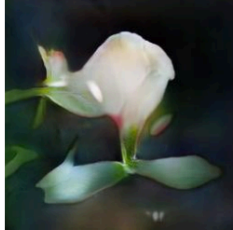

Stage-I

# Learning to Generate Images of Outdoor Scenes, Karacan et al. 2016

# Learning to Generate Images of Outdoor Scenes, Karacan et al. 2016

# Learning What and Where to Draw, Reed et al. 2016

This bird is completely black.

This bird is bright blue.

a man in an orange jacket, black pants and a black cap wearing sunglasses skiing

# GAN code

- Lots of code repos online for GANs, DCGANs, StackGAN, etc.
- Many TensorFlow tutorials, video walkthroughs, posts on Medium, etc

# Project 2

- Generate novel output using an RNN
- Understand how to read and write Tensorflow code (lots of examples, tutorials online to learn from)
- Can work alone, or in groups of 2 or 3

# Next Week

- Project 2, (informal) progress reports
- See syllabus for reading assignment
